**Formation of value orientations of Chinese youth in the system of technical education**

**Аннотация:** Chinese scientists believe that talented but immoral people pose a great danger to society. They regard morality as noble moral qualities, and its basis is “correct life and values.” Therefore, Chinese education has always attached great importance to the education of students. This idea implemented at all levels of education, and higher engineering education is no exception.

To introduce future engineers to “correct life and values,” the content of professional education at Chinese universities includes academic disciplines related to the study of ideological ethics and the rule of law, Marxist philosophy and modern Chinese history, Mao Zedong thought and the theory of socialism, Chinese language and politics, Marxism-Leninism and the theory of Deng Xiaoping, the thoughts of the Three Representatives and Xi Jinping's thought on socialism with Chinese characteristics for a new era.

The main task of the engineering education system is to create conditions for future engineers to understand and accept the basic values of socialism, the need to work hard for the good of the country and people.
