**Advantages and disadvantages of SRS system in attracting students to scientific work in the field of “green” energy**

**Abstract:** Currently, Student Research Societies (SRS) are one of the most important forms of organization and support for student scientific work by universities and the government. These societies, which are usually interdepartmental or interfaculty in nature, allow students to form effective interdisciplinary teams to tackle current and important scientific issues. As a relatively new approach to organizing scientific work, SRSs are still experiencing the stage of "growing pains," which affects their efficiency. This report provides analysis of both advantages and disadvantages of the current approach to student research work within SRSs.
